ABSTRACT

In September 1980 SAI was tasked to support the Tactical ASW Environmental Acoustic Support (TAEAS) project in developing Navy Standard Transmission-Loss Model (FACT) updates that incorporated several previously developed routines. Specifically the modifications addressed problems associated with surface ducts, cusped caustics, and the treatment of rough surface losses.

These modifications have been assembled and provided to NORDA 320 for distribution. The computer implementation of these improvements is briefly described in this report; complete technical documentation and test cases are included in a companion report.

SUMMARY OF FACT MODIFICATIONS

The TAEAS Program provides environmental acoustics support to a number of Fleet commands. This support includes the development and maintenance of the tactical prediction model, ASRAP. Recently SAI has developed a set of modifications to the FACT Model (the transmission-loss component of ASRAP) to improve the treatment of surface ducts, rough surface scattering and cusped caustics. These model updates were assembled in an internally consistent form and provided to NORDA 320 under this contract. Complete technical documentation, source code listings and test cases are presented in a companion report.

Reference: Spofford, C.W., et. al., "Implementation of Rough Surface, Surface Duct and Cusped Caustic Improvements in FACT," SAI-82-471-WA (March 1981)

The three specific areas addressed by this effort are outlined below:

- (1) Rough-Surface Scattering Losses: prior to these modifications FACT assumed perfect specular reflection; specular losses as a function of frequency, grazing angle, and sea-state have been introduced.
- (2) Surface-Ducted Propagation: the Clay model has been replaced by an rms mode model with more appropriate environmental sensitivity and a more reasonable depth dependence.

- (3) Cusped Caustic Modifications: the treatment of the ray family associated with cusped caustics has been expanded to consider the possible presence of an imbedded smooth caustic.

Several major differences are observed in a review of the test cases generated by the modified version vice those obtained from the original FACT Model. Most notably these include:

- (1) Differences in Convergence zone descriptions
- (2) Sensitivity of non-ducted path to wave height
- (3) More detailed depth-dependence of surface-ducted propagation.

The net result is a more accurate propagation-loss prediction for environmental conditions that were previously either poorly treated or ignored.

MEMORANDUM FOR DISTRIBUTION LIST

Subj: DECLASSIFICATION OF LONG RANGE ACOUSTIC PROPAGATION PROJECT
(LRAPP) DOCUMENTS

Ref: (a) SECNAVINST 5510.36

Encl: (1) List of DECLASSIFIED LRAPP Documents

1. In accordance with reference (a), a declassification review has been conducted on a number of classified LRAPP documents.
2. The LRAPP documents listed in enclosure (1) have been downgraded to UNCLASSIFIED and have been approved for public release. These documents should be remarked as follows:

Classification changed to UNCLASSIFIED by authority of the Chief of Naval Operations (N772) letter N772A/6U875630, 20 January 2006.

DISTRIBUTION STATEMENT A: Approved for Public Release; Distribution is unlimited.

3. Questions may be directed to the undersigned on (703) 696-4619, DSN 426-4619.

A handwritten signature in black ink, appearing to read "B. Link".
